Scaling the L1 Network

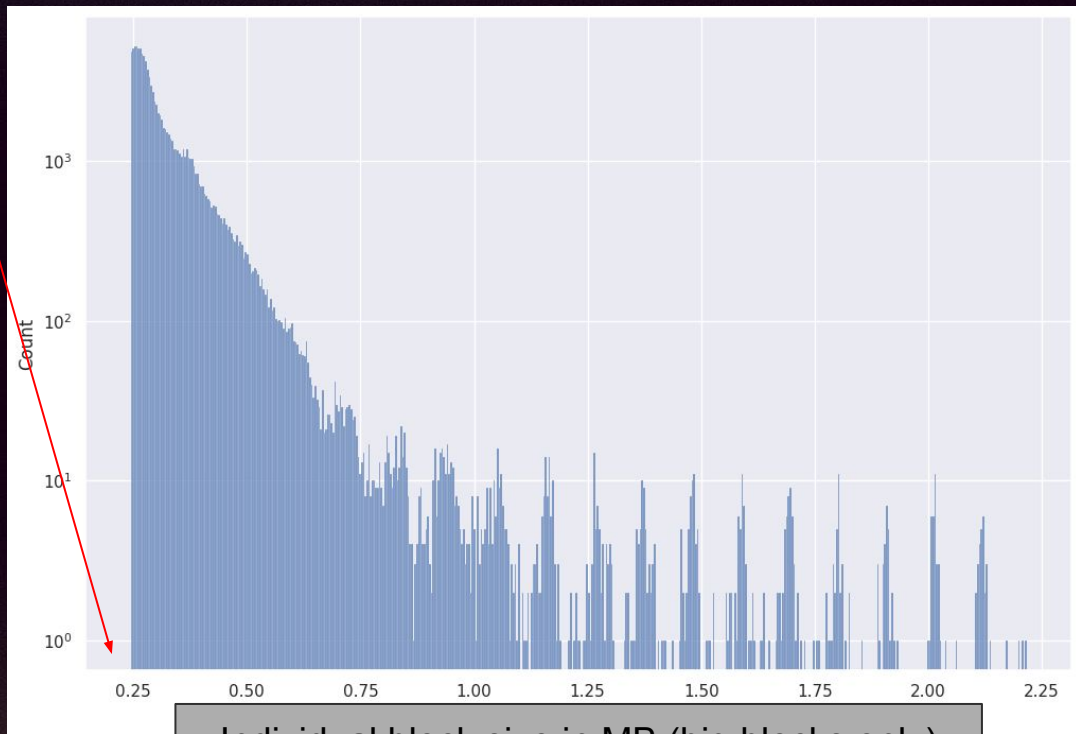

Average block size ... and the tail distribution, without averaging

Average block size, ~100 KB

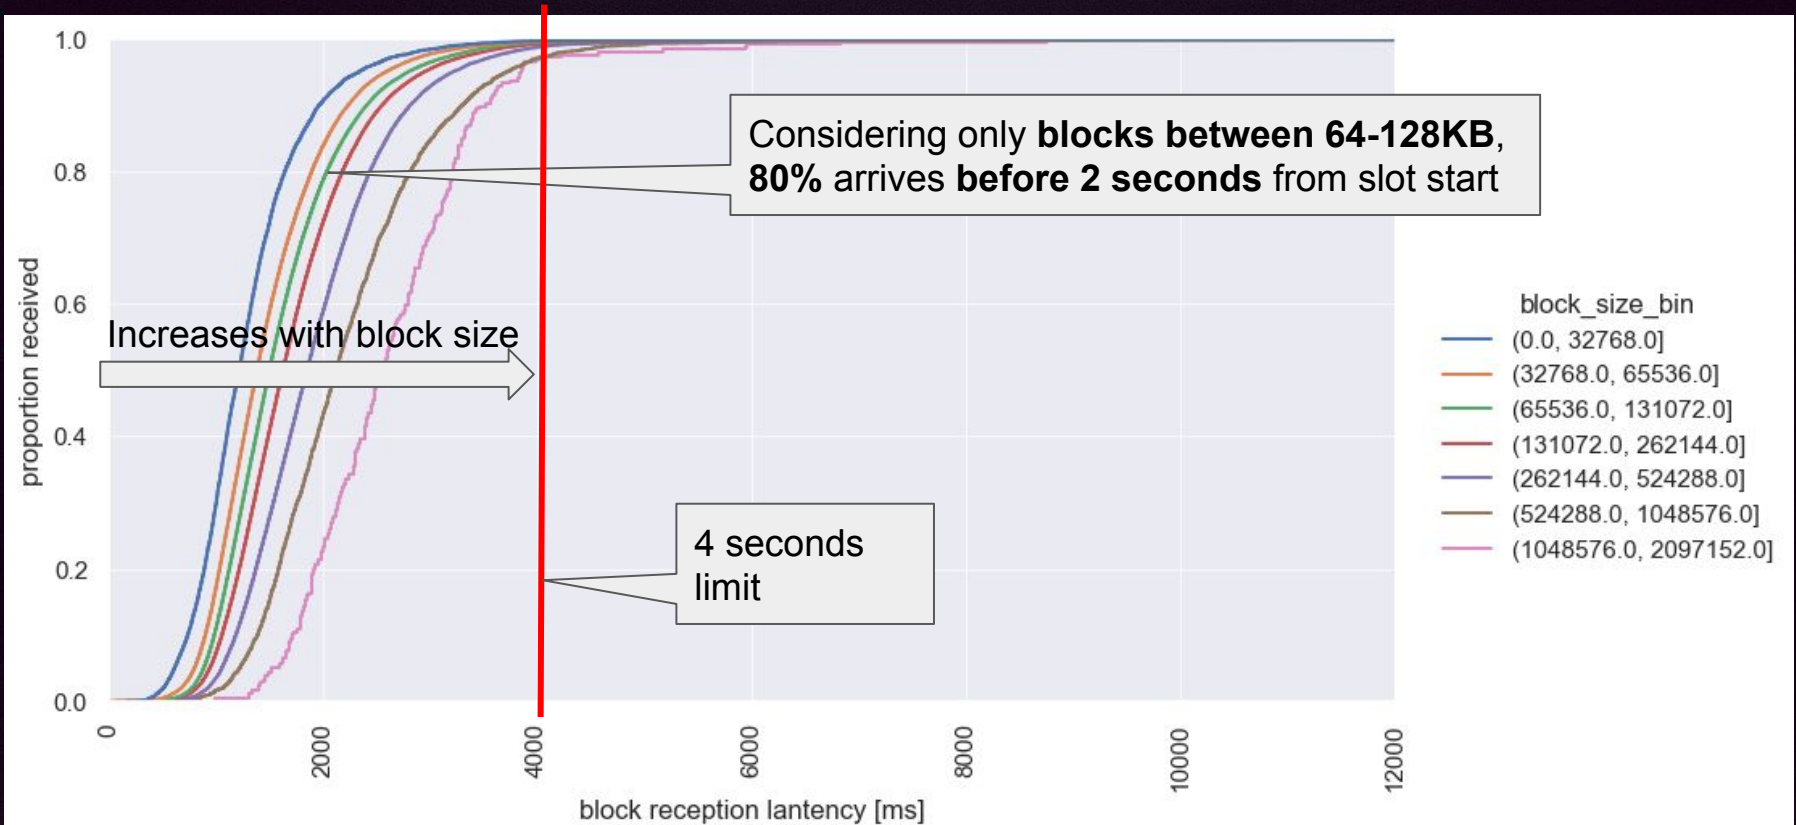

Big (>250KB) blocks on mainnet

- Big blocks injected for experimentation (2023 July)
- “Organic” big blocks observed later

Individual block size in MB (big blocks only)

Block Propagation Latency

Path to L1 Scalability

1. Changing the **slot timing window**, changing **resource requirements**
 - Controversial
 - Small gains, but lot to lose
2. **GossipSub** improvements for large messages
 - Important, but not my talk today
 - Relatively small gains
3. **Sharding** and **Data Availability Sampling** (DAS)
 - Large gains
4. **Distributed Block Building**
 - Intertwined, but large gains
 - Rethinking data flow for the whole blob transaction lifecycle

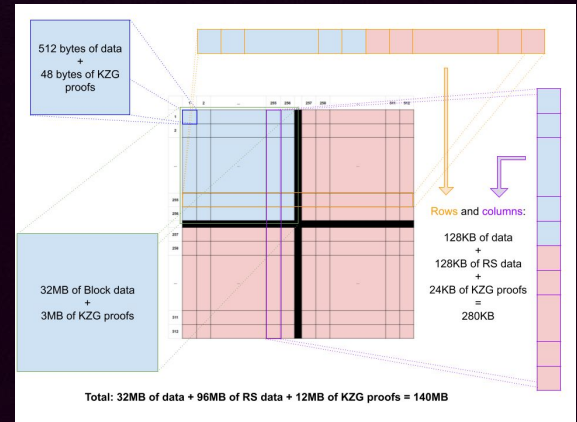

Sharding and DAS over the Network

DAS key concepts

Data Preparation

- **Blobs** (a.k.a. data availability space)
- **Encoding** (RS code and KZG commitments)
 - Segment
 - Extend
 - Commit

Over the network

- **Sampling** ... from where? How?

DA + S

DA: Dispersal of blob data to **custody**

- Ensuring **Data Availability**, while **Sharding**

S: Sampling from **custody**

- **Testing** Data Availability

DA + S

DA: Dispersal of blob data to custody

- Ensuring **Data Availability**, while **Sharding**

S: Sampling from custody

- Testing Data Availability

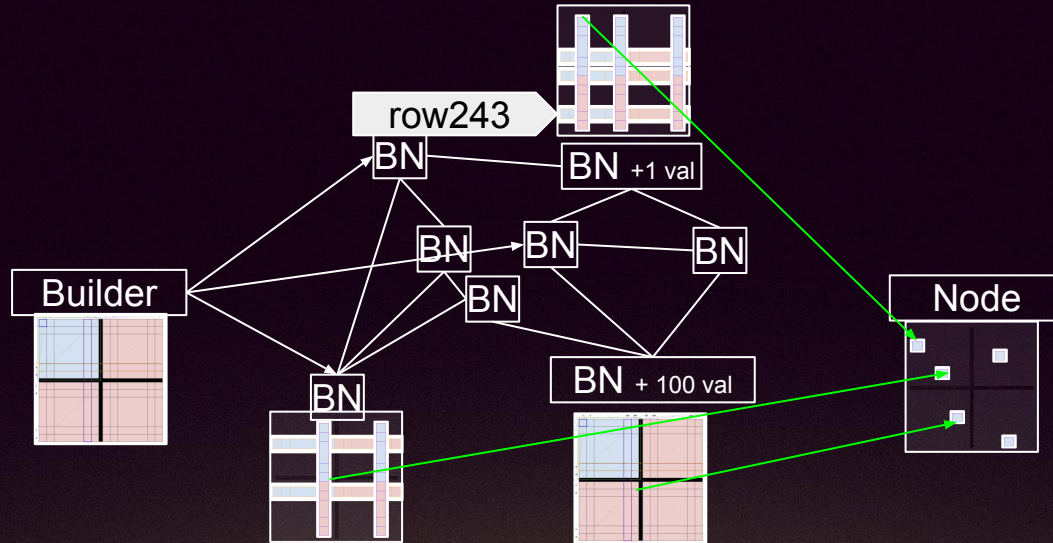

DA + S

- Testing** Data Availability

DA + S

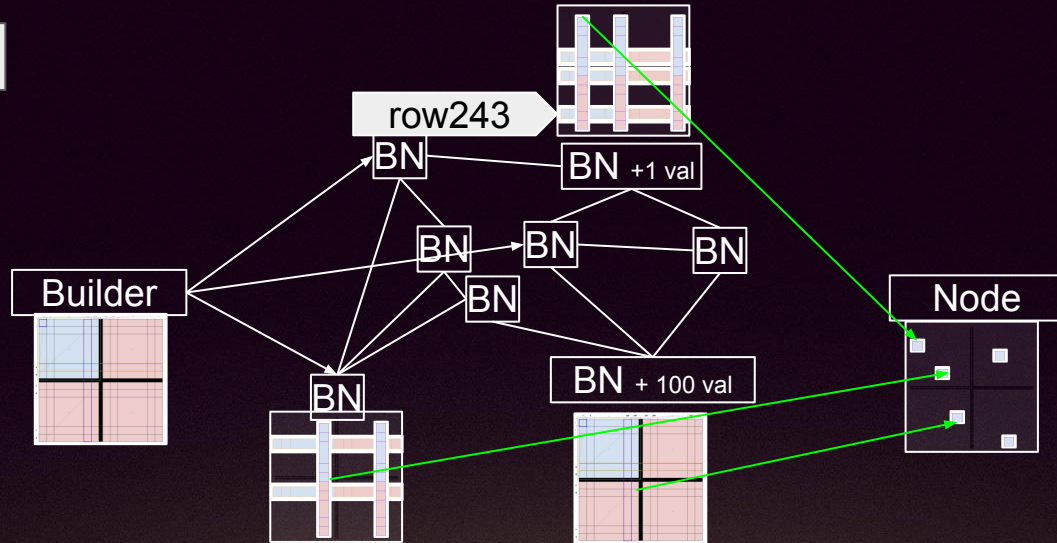

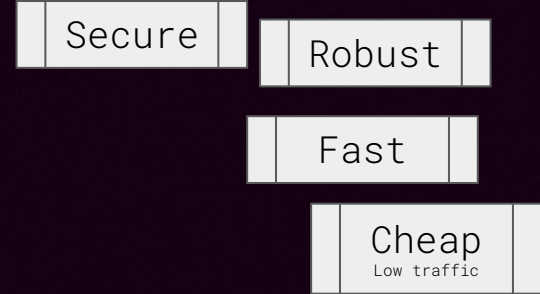

DA: Dispersal of blob data to custody

- Ensuring **Data Availability**, while **Sharding**

S: Sampling from custody

- Testing Data Availability

PeerDAS to FullDAS: the 32MB challenge

LossyDAS, IncrementalDAS,
and DiDAS to absorb false
negatives

2D encoding with on-the-fly
Availability Amplification

Enhanced and efficient
discovery with **Topic Routing**

Ephemeral Connect for fast
sampling

liteDAS for fast, robust,
bandwidth efficient and
reliable sampling

Rarest-first and non-TCP
transport for fast segment
dispersal

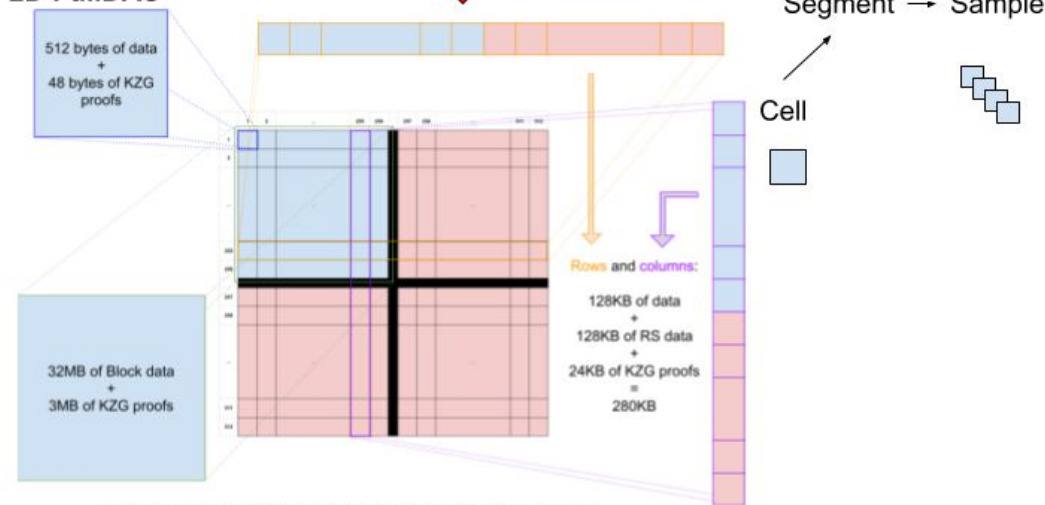

Push-pull state transition and
IDONTWANT to reduce
bandwidth

1D PeerDAS

Proposed new components

2D FullDAS

Total: 32MB of data + 96MB of RS data + 12MB of KZG proofs = 140MB

So what's the difference?

PeerDAS

FullIDAS

So what's the difference?

PeerDAS

Cheap

Robust

Fast

Secure

FullDAS

Cheaper

More Robust

Faster

More Secure

So what's the difference?

PeerDAS

Cheap

Robust

Fast

Secure

FullDAS

Cheaper

Sampling at **cell level**,
smaller traffic volume

More Robust

2D erasure code allows local repair,
no need for large nodes

Faster

New pub-sub and sampling protocols
make it faster

More Secure

Rethinking the data flow

5, Dispersing blob pieces
(libp2p, push/pull)

4, Building the block

3, Mempool exchanges
(devp2p, pull)

2, A blob tx is sent

1, A blob tx is sent

Thank you!
