2008

BITCOIN

A PEER-TO-PEER
ELECTRONIC
CASH SYSTEM

Abstract. A purely peer-to-peer version of electronic cash would allow online payments to be sent directly from one party to another without going through a financial institution. Digital signatures provide part of the solution, but the main benefits are lost if a trusted third party is still required to prevent double-spending.

STILL HAS NOT TAKEN OVER THE WORLD :(

2008

Ancient...

BRRRR

hehe

Answer to 2007-8 crisis?

P2P

P2P Network Fundamental Concepts Explained
with Example -

Peer-to-Peer model

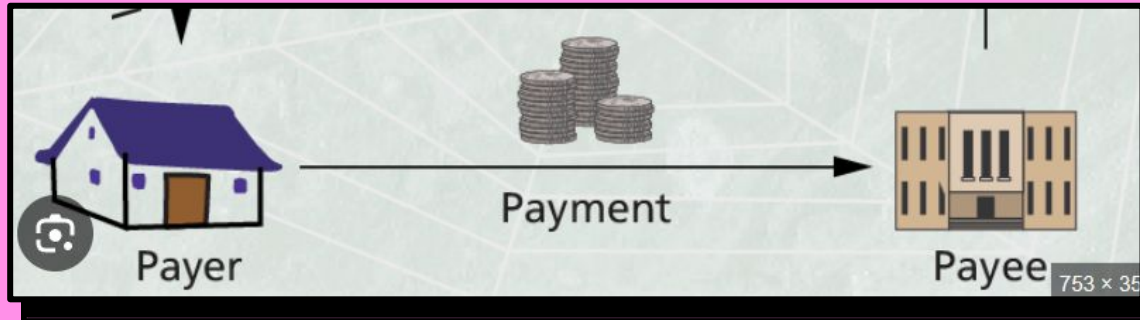

CASH \neq GOLD

CASH == RAW PAYMENT

Cards:

- Chargebacks.
- Credit / Debit.
- POINTSSSS & rewards lol.

SCALABILIT
Y

SCALABILITY

- > In order to compete with tradfi payments, we have to be similarly cheap and fast. Visa has 24k TPS.
- > Btw, my new altchain has 69k tps.

SCALABILITY

1. This mistakes card payments (e.g. chargebacks, rewards) with cash (raw payment).
2. Some payments should already be cost effective
 - a. Large
 - b. Rare international pairs (many hops)

SCALABILITY

- > *Startup idea: a TransferWise but with crypto rails.*
- > *Replace just what's costly. No need for e2e.*

SCALABILITY

You need two banks to agree to not ban you. But if you can get two banks to sign contracts then you might as well just use tradfi IOUs.

PRIVACY

PRIVACY

Hard privacy: Monero & Zcash.
Obfuscation: CEXes.

STABLE
VALUE

STABLECOINS

> You can't make payments in a highly volatile currency.

STABLECOINS

1. That's false. Many national currencies are highly volatile.
2. Rails thesis (only use crypto for settlement, but not e2e) still holds.

ACCOUNTS

AA

> AA is necessary for mass adoption in payments. Better onboarding, account recovery, granular permissions etc.

Again, a subset works. Yet, we've not even seen a subset.

***UNLOCK FOR
MASS PAYMENTS?***

INTEROP

(To avoid the 1 chain 1 token bootstrapping problem)

INTEROP THESIS

Interoperability is a necessary condition for interchangeability, which is a necessary condition for any new payments network.

*"I have coins on Scroll, and I want to pay [you] for coffee ... you are only set up to receive coins on Taiko. Wat do?"
- Vitalik, Ethereum Intern*

*"I have coins but you want fiat.
Wat do?"
- peanut brain at peanut

TRADFI INTEROP

NNN Challenge

NO

CHALLENGE

BOB

Another category of solutions has to do with abandoning the concept of user-facing addresses altogether, in a similar spirit to [the Bitcoin payment protocol](#). One idea is to rely more heavily on direct communication channels between the sender and the recipient; for example, the sender could send a claim link (either as an explicit URL or a QR code) which the recipient could use to accept the payment however they wish.

Is visa just eating our lunch?

TRADFI INTEROP

BITCOIN

“Bitcoin ... discovered how to send value or money over the internet ... especially for the people around the world that are unbanked”

Interview Jinyoung Lee Englund, Bitcoin Foundation - Zermatt Summit 2014

This is where crypto shines!
